# Efficacy and safety of the novel capsid inhibitor lenacapavir to treat multidrug-resistant HIV: week 52 results of a phase 2/3 trial

Onyema Ogbuagu, Sorana Segal-Maurer, Winai Ratanasuwan, Anchalee Avihingsanon, Cynthia Brinson, Kimberly Workowski, Andrea Antinori, Yazdan Yazdanpanah, Benoit Trottier, Hui Wang, Nicolas Margot, Hadas Dvory-Sobol, Martin S Rhee, Jared M Baeten, Jean-Michel Molina, on behalf of the GS-US-200-4

## A Trial design

Randomly assigned col  
Stable viraem  
HIV-1 RNA o  
≥400 copies  
during screen  
period

Non-randor  
assigned col  
Reduced vira  
HIV-1 RNA o  
<400 copies  
during screen  
period, or  
enrolment after  
cohort 1 filled

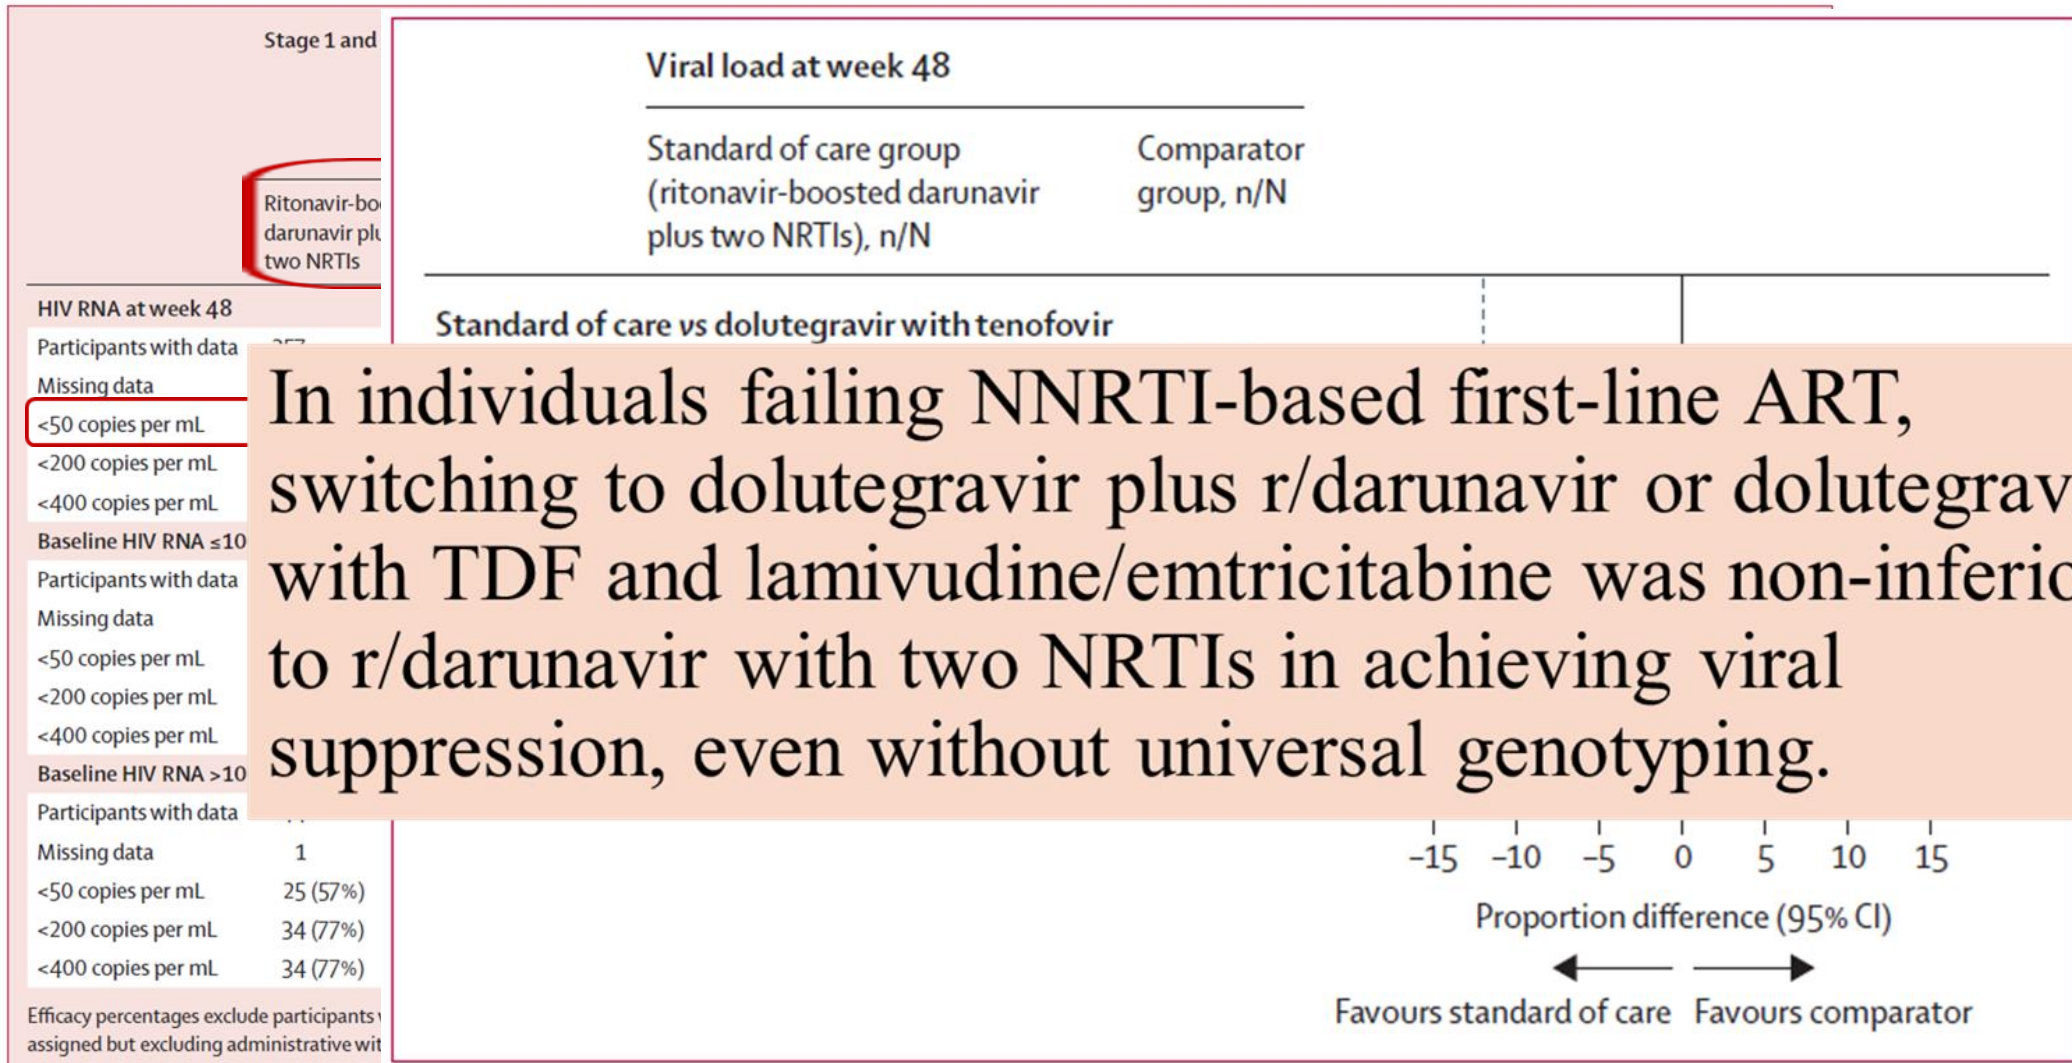

In participants with multidrug-resistant HIV-1, subcutaneous lenacapavir combined with an optimized background regimen achieved high virological suppression rates through 52 weeks.

## A Estimated Treatment Effect

Subgroup	Pitavastatin (N=3888) <i>no./1000 person-yr (no. of events)</i>	Placebo (N=3881) <i>no./1000 person-yr (no. of events)</i>	Hazard Ratio (95% CI)
Primary outcome and supporting analyses			
First MACE	4.81 (89)	7.32 (136)	0.65 (0.48 to 0.90)
First MACE including vital status follow-up	4.75 (90)	7.22 (137)	0.66 (0.50 to 0.86)

Pitavastatin  
Secondary outcomes and supporting analyses  
General  
Individual components of MACE

First confirmed MACE
First MACE (as-treated analysis)
First MACE (per-protocol analysis)
Secondary outcomes and supporting analyses
First MACE or death
First MACE or death including vital status follow-up
Death from any cause
Individual components of MACE
First cardiac catheterization or revascularization
First carotid or cerebrovascular revascularization
First peripheral arterial revascularization

Participants with HIV infection who received pitavastatin had a lower risk of a major adverse cardiovascular event than those who received placebo over a median follow-up of 5.1 years.

# The Effect of Open-Label Semaglutide on Metabolic Dysfunction–Associated Steatotic Liver Disease in People With HIV

- SLD is an independent CVD risk factor
- Semaglutide would reduce intrahepatic triglycerides

**Table 2.** Changes in IHTG, Cardiometabolic Parameters, and HIV-Associated Parameters

Outcome	Baseline	Week 24	Absolute Difference (95% CI)	Percentage Difference (95% CI)
<b>Primary</b>				
Mean IHTG (SD), %*	12.7 (6.1)	8.5 (4.7)	−4.2 (−5.4 to −3.1)	−31.3 (−39 to −23.6)
<b>Secondary</b>				
Mean weight (SD), kg	103 (20.8)	95.1 (22.8)	−7.8 (−9.5 to −6.1)	−8.1 (−9.8 to −6.4)
Mean BMI (SD), kg/m <sup>2</sup>				
Mean waist circumference (SD), cm				
Mean HOMA-IR score (SD)				
Mean fasting glucose level (SD), mg/dL				
Mean HbA <sub>1c</sub> level (SD), %				
Mean fasting total cholesterol level (SD), mg/dL‡	175 (43.3)	174 (34.8)	−4.0 (−10.8 to 2.9)	−0.2 (−4.2 to 3.7)
Mean fasting triglyceride level (SD), mg/dL§	150 (87.9)	131 (75.8)	−26.8 (−46.0 to −7.5)	−10.5 (−20.8 to −0.2)
Mean fasting HDL cholesterol level (SD), mg/dL‡	46 (10.5)	47.6 (11.4)	2.0 (−0.02 to 4.1)	5.3 (0.6 to 10.0)
Mean fasting LDL cholesterol level (SD), mg/dL‡	101 (35.1)	102 (30.7)	−1.0 (−7.1 to 5.1)	3.0 (−4.5 to 10.4)
<b>Other</b>				
Mean ALT level (SD), IU/L	30.7 (13.4)	24.8 (11.9)	−6.1 (−9.5 to −2.6)	−15.3 (−23.8 to −6.7)
Elevated ALT level, n (%)	26 (53)	20 (41.7)	−	−
Mean CD4 <sup>+</sup> T-lymphocyte count (SD), × 10 <sup>9</sup> cells/L	0.762 (0.340)	0.730 (0.302)	−0.014 (−0.081 to 0.053)	8.2 (−14.3 to 30.7)
HIV-1 RNA <50 copies/mL, n (%)	49 (100)	46 (97.9)	−	−

Semaglutide is an effective therapy for MASLD in PWH and shows evidence of broader cardiometabolic benefit

# Identifying risk factors for anal cancer in people with HIV in Spain: a multicenter study using data from the PISCIS cohort

Josep M Llibre, Boris Revollo, Marta Navarro, Elena Leon, Raquel Martin-Iguacel, on behalf of the PISCIS study group

Figure 1: Incidence rate: Point estimates are shown for 30-44 years, 45-59 years, and 60 years and older. MSM=men who have sex with men.

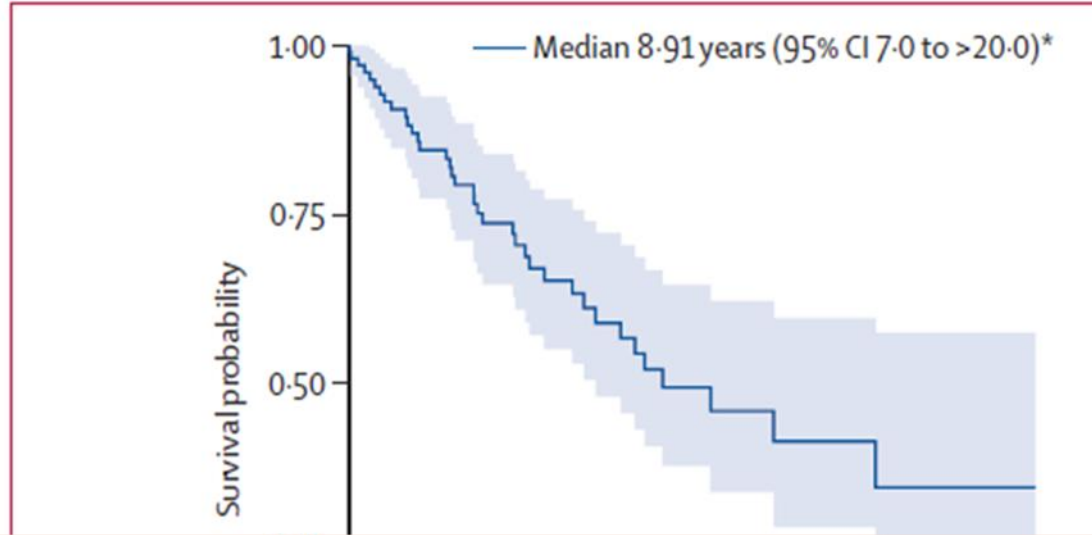

Figure 3: Survival analysis in people with HIV diagnosed with anal cancer

\*The upper limit extends beyond 20 years because it is constrained by the study's 20-year period and the insufficient number of events in this period.

Median

>4 count (cells per  $\mu\text{L}$ )

350

A nadir CD4 count below 350 cells/ $\mu\text{L}$ , especially under 200 cells/ $\mu\text{L}$ , may help identify HIV patients at higher risk for anal cancer. Targeted screening for these high-risk individuals could optimize resource use.

# Long-Acting Injectable CAB/RPV is Superior to Oral ART in PWH With Adherence Challenges: ACTG A5359 – CROI 2024

Phase III, randomized, open-

- PWH with persistent HIV-1 RNA > 200
- Endpoint: failure (confirmed HIV-1 RNA > 200 copies/mL) or treatment discontinuation

LA Cabotegravir & rilpivirine injections, administered monthly or every other month, offer an effective HIV treatment option for individuals struggling with daily pill adherence and maintaining viral suppression.

Table: Kaplan-Meier cumulative probabilities for primary and key secondary endpoints and difference in probabilities between LAI and SOC arms

Endpoint	CAB-LA/RPV-LA (n= 145*)		SOC (n=148)		Difference (nominal 98.75% CI)
	Failure, n	Cumulative Probability	Failure, n	Cumulative Probability	
Primary: Regimen failure (virologic)	28 (5+23) <sup>#</sup>	24.1%	47 (28+19)	38.5%	-14.4% (-29.8%, 0.8%)
Key secondary: treatment discontinuation					

\* One participant with ART information pending was excluded from the interim efficacy analyses. <sup>#</sup> One participant assigned to LAI had treatment discontinuation as the primary endpoint but subsequently experienced VF.

Feb 12, 2024, DSMB halted the study due to superior efficacy of LA CAB+RPV in secondary endpoints

# Prevention

# HIV-1 infection kinetics, drug resistance, and long-term safety of pre-exposure prophylaxis with tenofovir alafenamide

	Proteinuria
	Total†
Baseline	25/2687 (0.9%)
Week 48	25/2361 (1.1%)
Week 96	27/2181 (1.2%)
Week 144	15/1919 (0.8%)

Data are n/N (%) or median per centile (IQR) (range). UPCR=urine protein to creatinine ratio. †Total number of participants who received emtricitabine and tenofovir alafenamide at each timepoint (including those who discontinued the study) and N is the number of participants who were assessable for proteinuria at each timepoint.

Table 1: Quantitative proteinuria at baseline and 144 weeks of emtricitabine and tenofovir alafenamide

	Total population
Any treatment-emergent adverse event	2544 (94%)
Any grade 3 or 4 treatment-emergent adverse event	67 (3%)
Discontinuation of study drug due to adverse event	43 (2%)
Serious adverse events*	257 (10%)
Serious adverse events related to study drug†	3 (<1%)
Deaths‡	7 (<1%)

Routine HIV-1 RNA testing for individuals on daily oral PrEP offers modest clinical benefit. Long-term use of emtricitabine and tenofovir alafenamide as daily PrEP is safe, well tolerated, and suitable for those with bone or renal conditions.

	Number assessable (lipids)	Number assessable (glucose)
Baseline	1412	1426
Week 48	1160	1332
Week 96	1148	1216

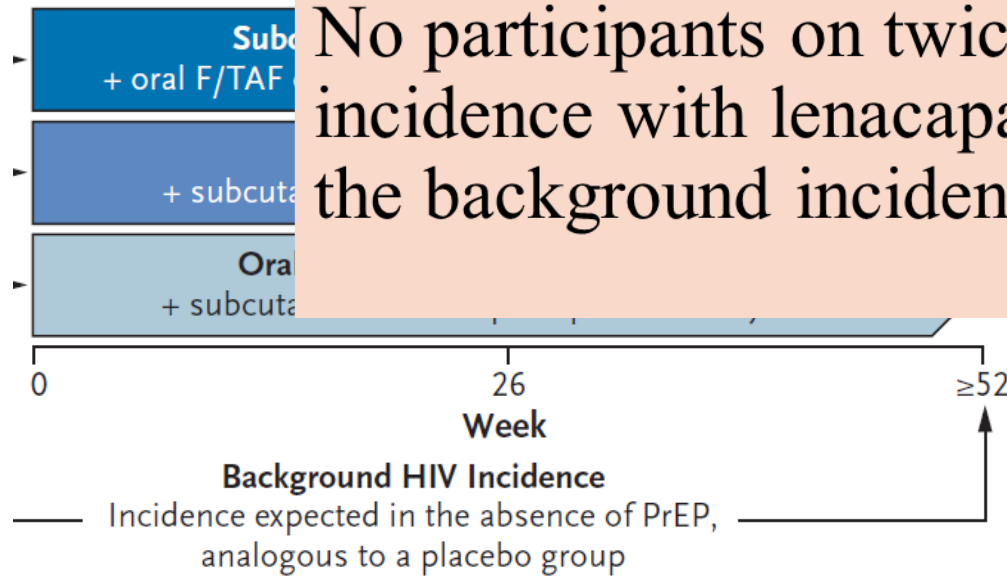

Nasopharyngitis	468 (17%)
Upper respiratory tract infection	456 (17%)
Urethritis chlamydial	394 (15%)
Urethritis gonococcal	295 (11%)

# Twice-Yearly Lenacapavir or Daily F/TAF for HIV Prevention in Cisgender Women

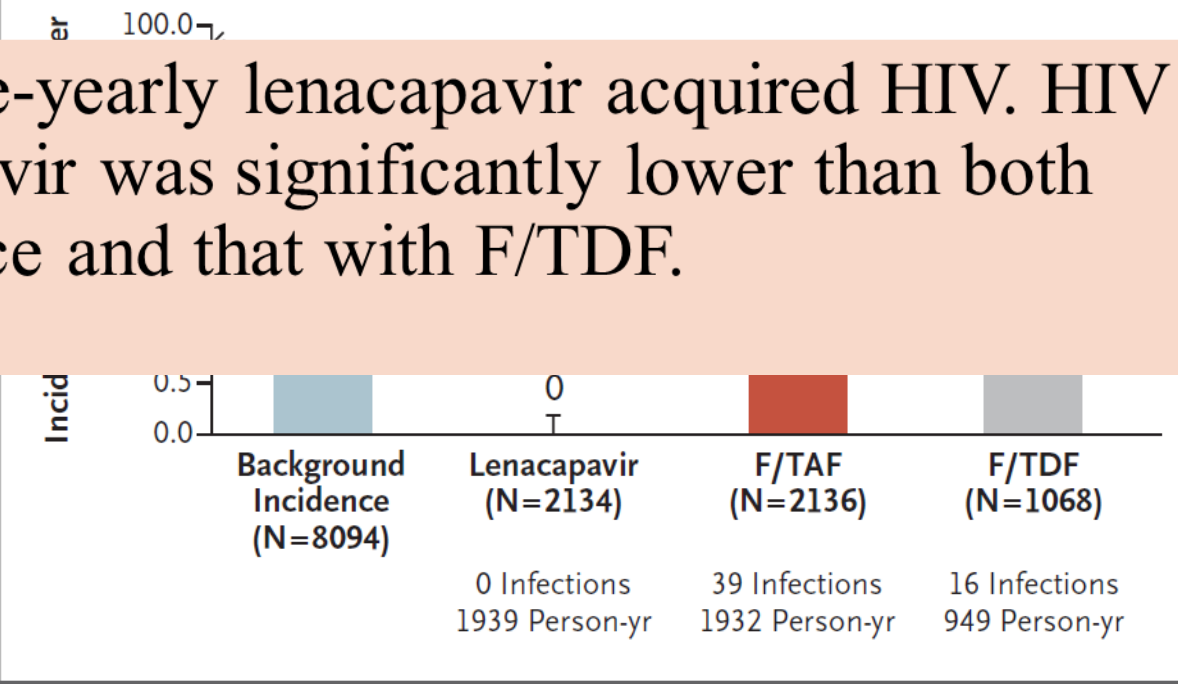

L.-G. Bekker, M. Das, Q. Abdool Karim, K. Ahmed, J. Batting, W. Brumskine, K. Gill, I. Harkoo, M. Jaggernath, G. Kigozi, N. Kiwanuka, P. Kotze, L. Lebina, C.E. Louw, M. Malahleha, M. Manentsa, L.E. Mansoor, D. Moodley, V. Naicker, L. Naidoo, M. Naidoo, G. Nair, N. Ndlovu, T. Palanee-Phillips, R. Panchia, S. Pillay, D. Potloane, P. Selepe, N. Singh, Y. Singh, E. Spooner, A.M. Ward, Z. Zwane, R. Ebrahimi, Y. Zhao, A. Kintu, C. Deaton, C.C. and F. Matovu Kiweewa, for the PURPOSE 1 Study

Randomized Cohort

No participants on twice-yearly lenacapavir acquired HIV. HIV incidence with lenacapavir was significantly lower than both the background incidence and that with F/TDF.

**A** Background HIV Incidence and HIV Incidence in Lenacapavir, F/TAF, and F/TDF Groups

# Wrap-up

- Long-acting injectable regimens show promise as second-line therapy, particularly in MDR-HIV.
- Dolutegravir-based regimens are robust for treatment-experienced patients and those failing NNRTI-based ART.
- BPaLM regimen is a new standard for rifampicin-resistant TB treatment.
- Statins and semaglutid are effective in reducing CVD risk
- Nadir CD4 counts can be useful in identifying HIV patients at higher risk of anal cancer, allowing for targeted screening.
- Long-term PrEP is safe, particularly for those with bone or renal concerns and new PrEP regimens are in development
