Study of Intestinal Microbiota in Patients with Atopic Dermatitis

General Objetives

1. To analyze the **gut microbiota composition** of patients with atopic dermatitis, from a stool sample, through shotgun sequencing and bioinformatic analysis, comparing it with a healthy control group of similar gender and age distribution.

2. To study the **functional profile of the gut microbiota** of patients with atopic dermatitis from the metagenomes obtained by shotgun sequencing the fecal microbiota (objective 1), by identifying microbial metabolic pathways and comparing them with healthy individuals.

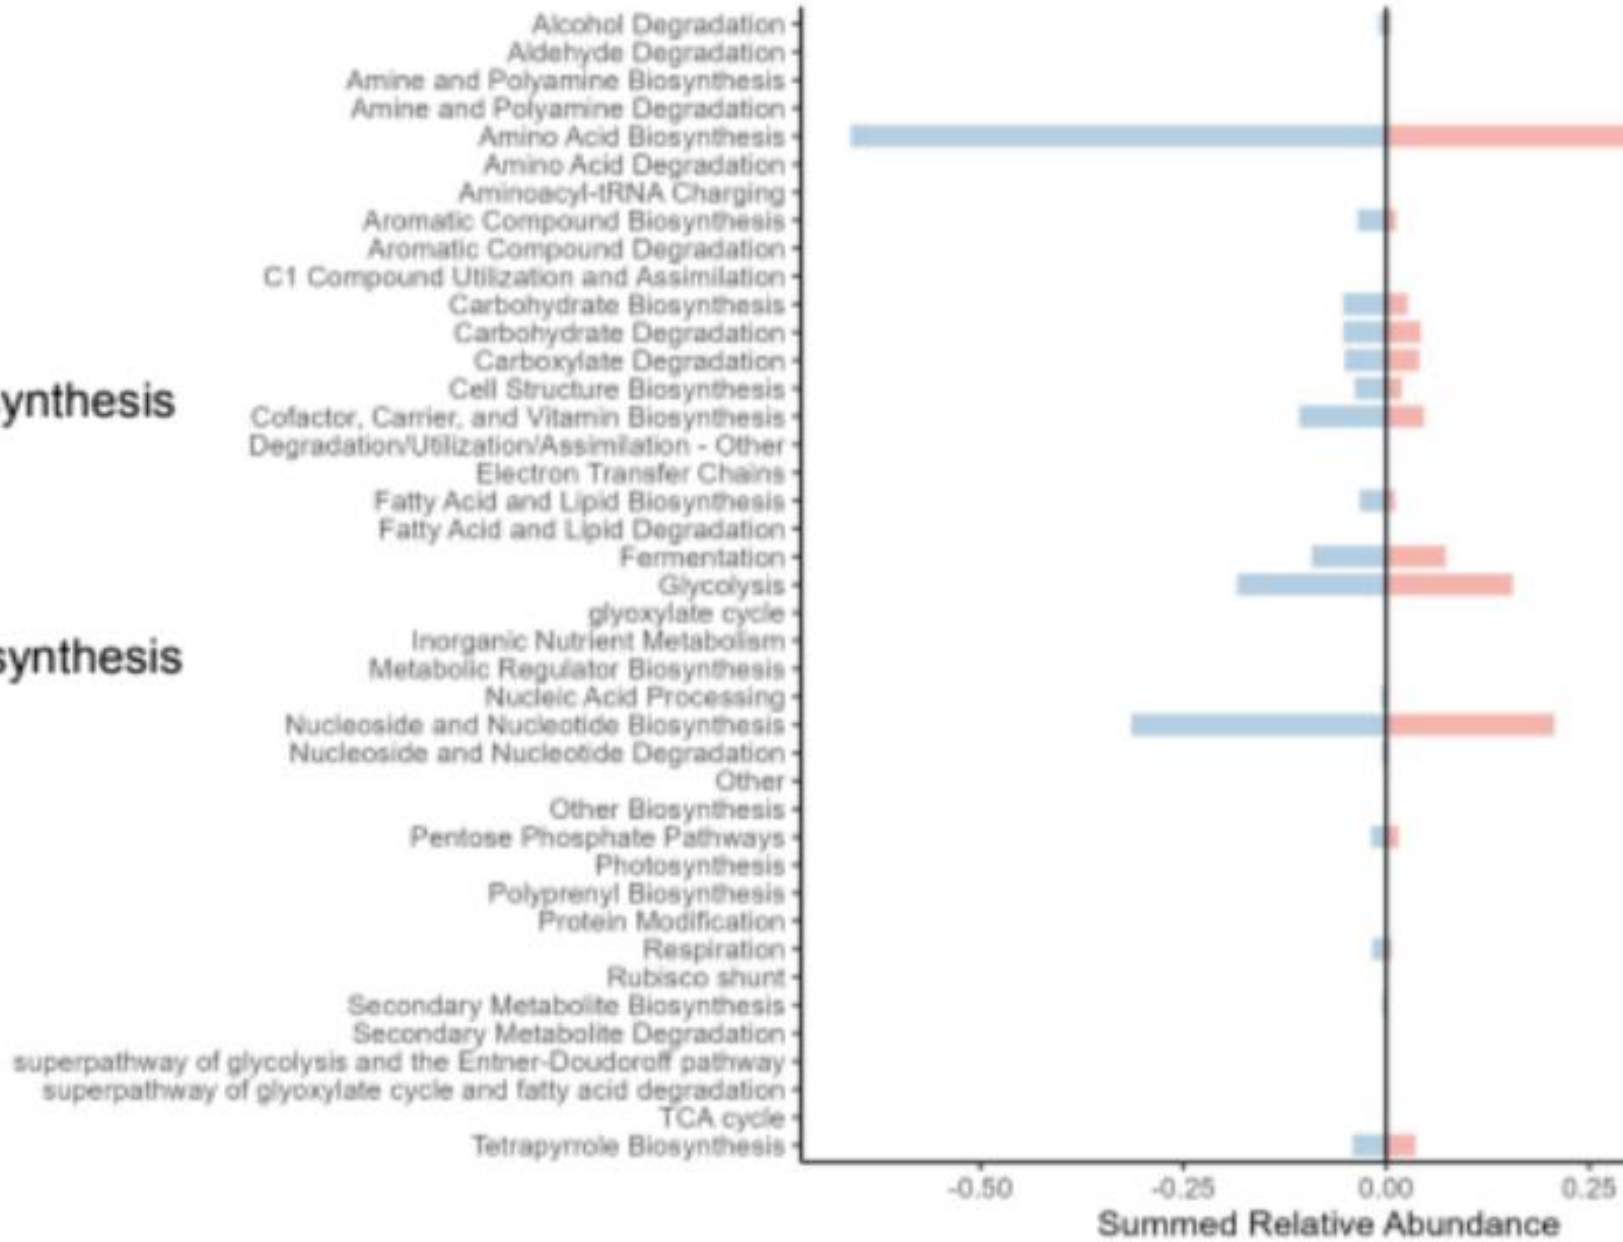
Functional Analysis

Metabolic pathways abundance

Decreased in AD patients

- Amino acids biosynthesis
- Cofactor, carrier and vitamin biosynthesis
- Fatty acid and lipid biosynthesis
- Energy metabolism
  - Nucleotide and nucleoside biosynthesis
  - Glycolysis
  - Fermentation



Conclusions

- The quantification of short-chain fatty acids and cytokines in fecal samples did not show significant differences between atopic dermatitis patients and healthy individuals.
- The patients with AD showed a lower number of OTUs detected, implying a lower bacterial diversity both in richness and in homogeneity.
- The bacterial families *Methanobacteriaceae*, *Ruminococcaceae*, *Lachnospiraceae*, and *Akkermansiaceae* are significantly decreased in AD patients.
- Several metabolic pathways are decreased in AD patients, including amino acid biosynthesis, cofactor, carrier and vitamin biosynthesis, fatty acids and lipids biosynthesis, and energy metabolism.
- This study lays the groundwork for more comprehensive studies providing one of the first taxonomic and functional metagenomic analysis on fecal microbiota in atopic dermatitis in adults.

Future perspectives

- Possible **targets for microbiome modulation**

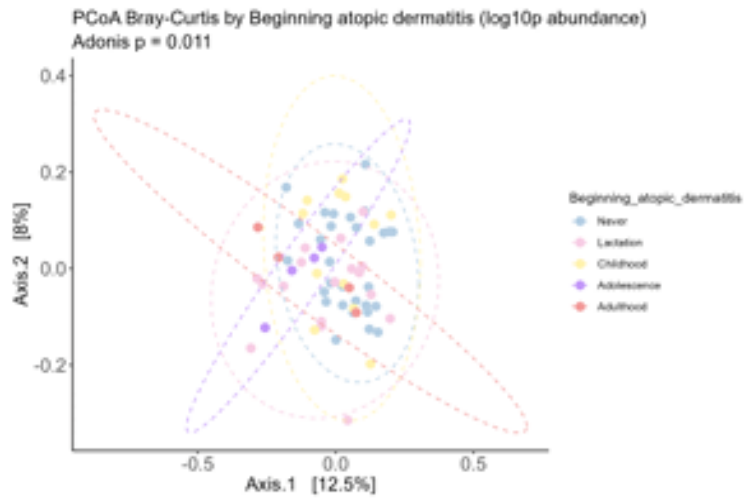
Bacterial populations

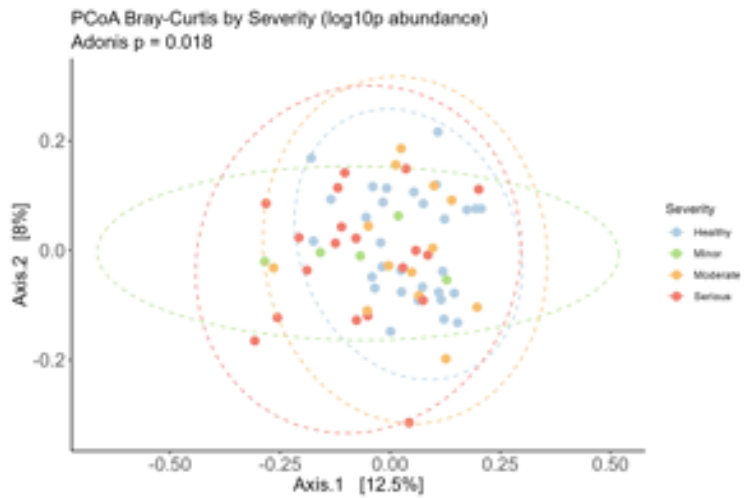
- *Methanobacteriaceae*
- *Ruminococcaceae*
- *Lachnospiraceae*
- *Akkermansiaceae*

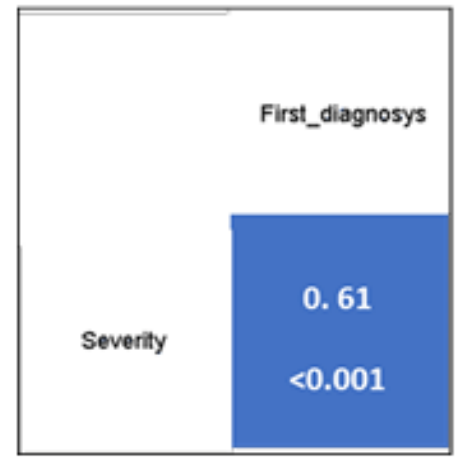
Metabolic routes

- Amino acid biosynthesis
- Vitamin biosynthesis
- Lipid biosynthesis
- Energy metabolism

- **Diagnosis during lactation** is related with changes in the microbiome respect to controls, but also with the seve the disease, which makes it an **interesting target population**



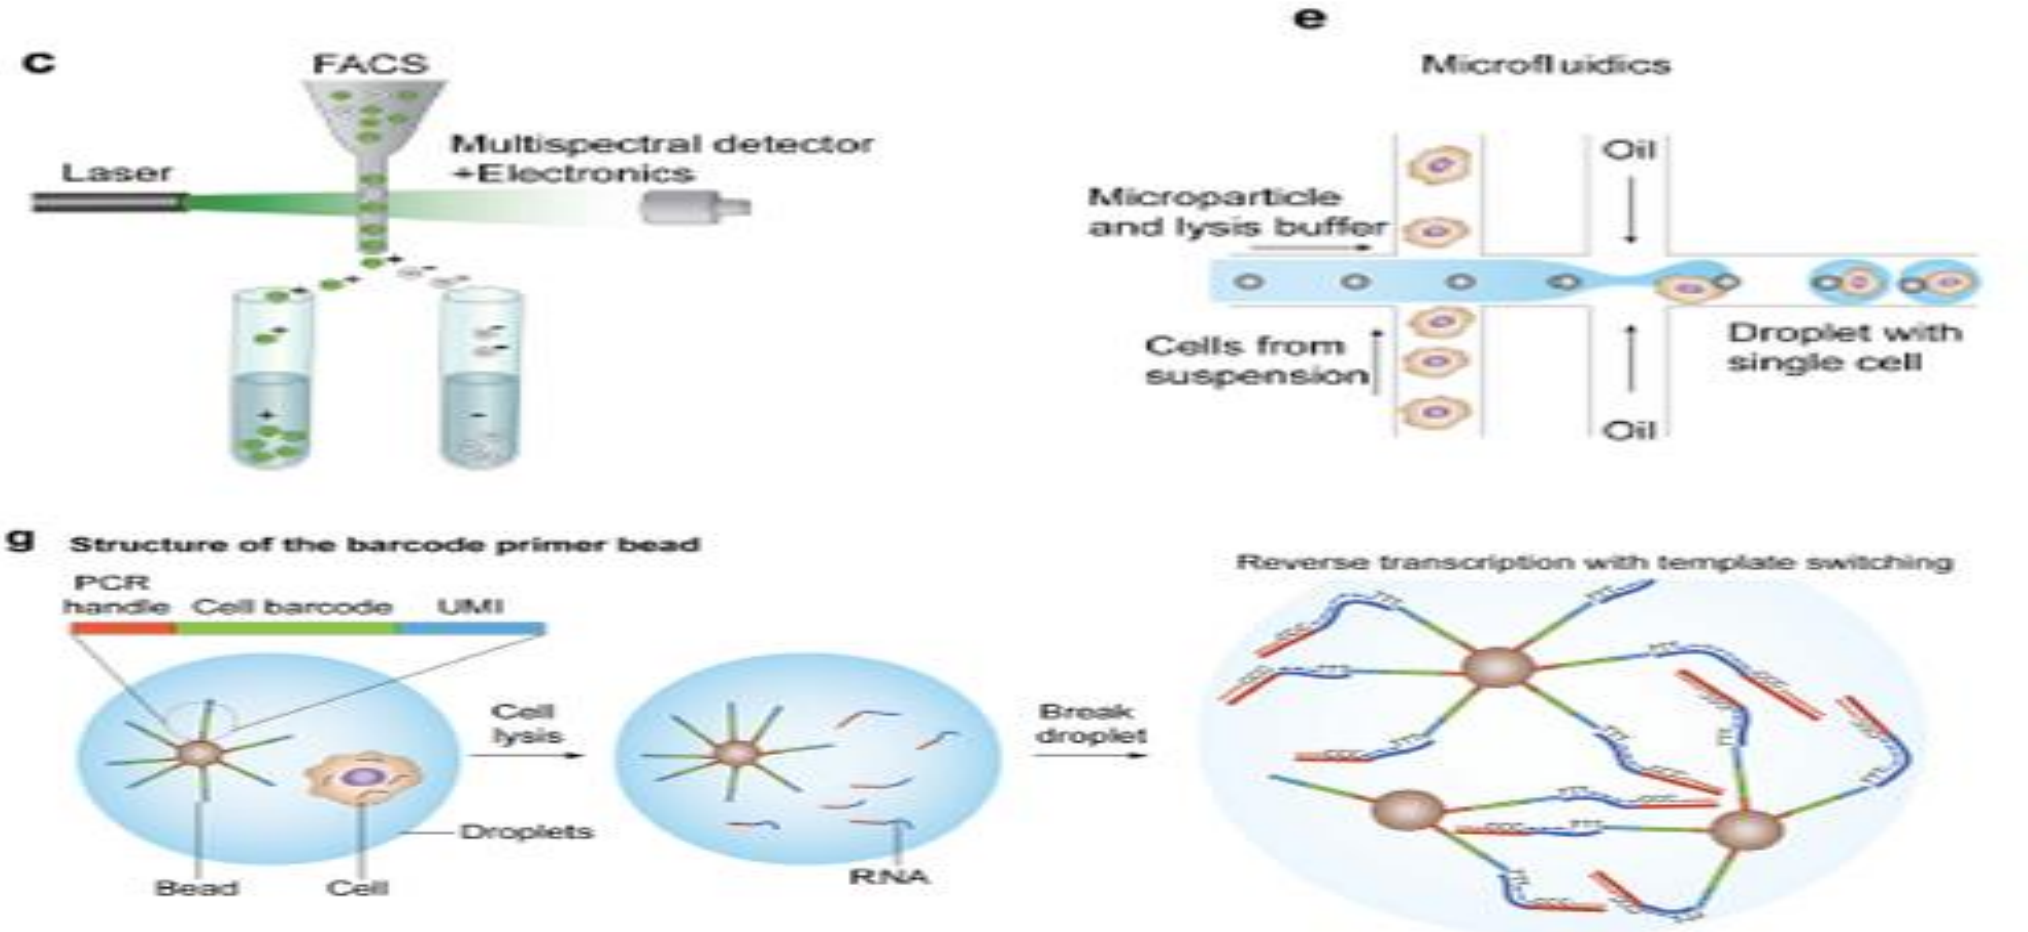




- **Early monitoring and modulation** of these bacterial features seems essential to fight against atopic dermatitis

Conclusions

- The quantification of short-chain fatty acids and cytokines in fecal samples did not show significant differences between atopic dermatitis patients and healthy individuals.
- The patients with AD showed a lower number of OTUs detected, implying a lower bacterial diversity both in richness and in homogeneity.
- The bacterial families *Methanobacteriaceae*, *Ruminococcaceae*, *Lachnospiraceae*, and *Akkermansiaceae* are significantly decreased in AD patients.
- Several metabolic pathways are decreased in AD patients, including amino acid biosynthesis, cofactor, carrier and vitamin biosynthesis, fatty acids and lipids biosynthesis, and energy metabolism.
- This study lays the groundwork for more comprehensive studies providing one of the first taxonomic and functional metagenomic analysis on fecal microbiota in atopic dermatitis in adults.

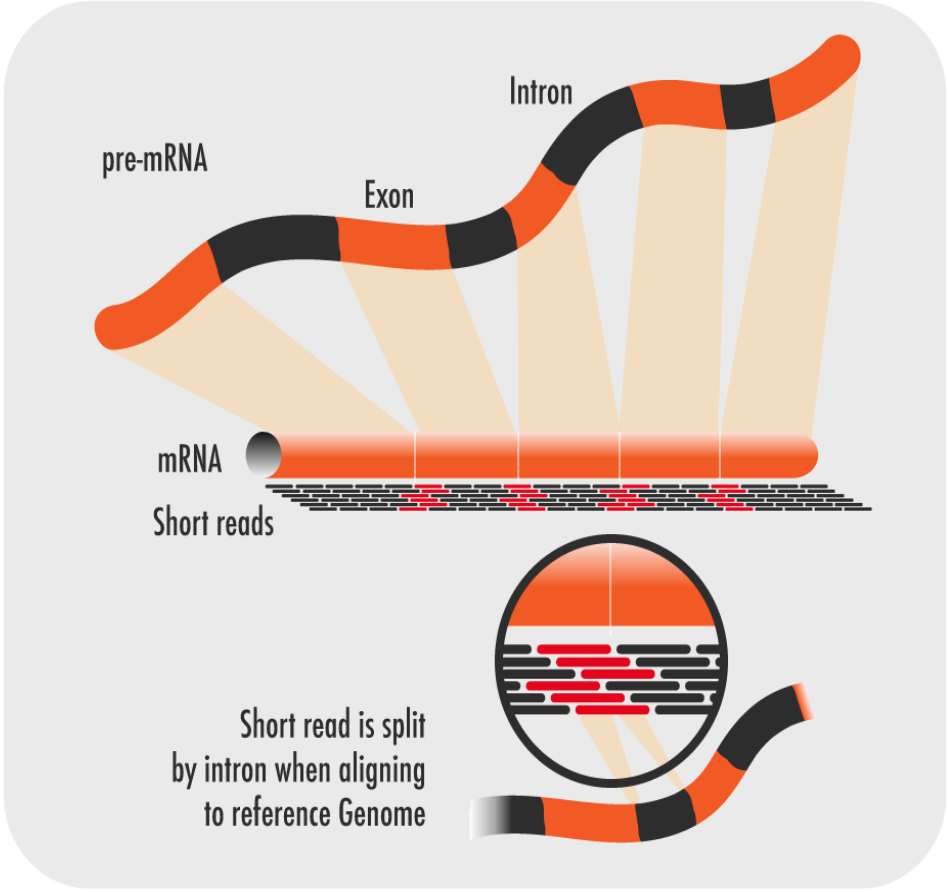


Hwang, B., Lee, J. H., & Bang, D. (2018). Single-cell RNA sequencing technologies and bioinformatics pipelines. *Experimental & molecular medicine*, *50*(8), 1-14. (editado)

- ¿Qué zona de la placa tiene potencial para iniciar todo el proceso inflamatorio?

¿Qué es el RNAseq?

- RNA-seq :observación de transcritos resultantes del empalme alternativo, modificación postranscripcional, fusiones génicas, mutaciones/SNPsy cambios de expresión de genes a lo largo del tiempo.
  - el proceso implica la obtención de RNA total, la RNA Seq puede ayudar a caracterizar poblaciones diferentes de RNA como miRNA, tRNA, y rRNA5 Esta tecnología, además, también puede servir para determinar las fronteras exón / intrón y verificar o enmendar regiones 5 'y 3'.
  - bioinformática asociada a las tecnologías NGS es por tanto una disciplina joven, y carente de estandarización a la hora de abordar un problema. Es por ello que es común que distintos investigadores programen cada uno su propia solución a una misma en la mayoría de casos, igual de válidas las distintas herramientas desarrolladas.

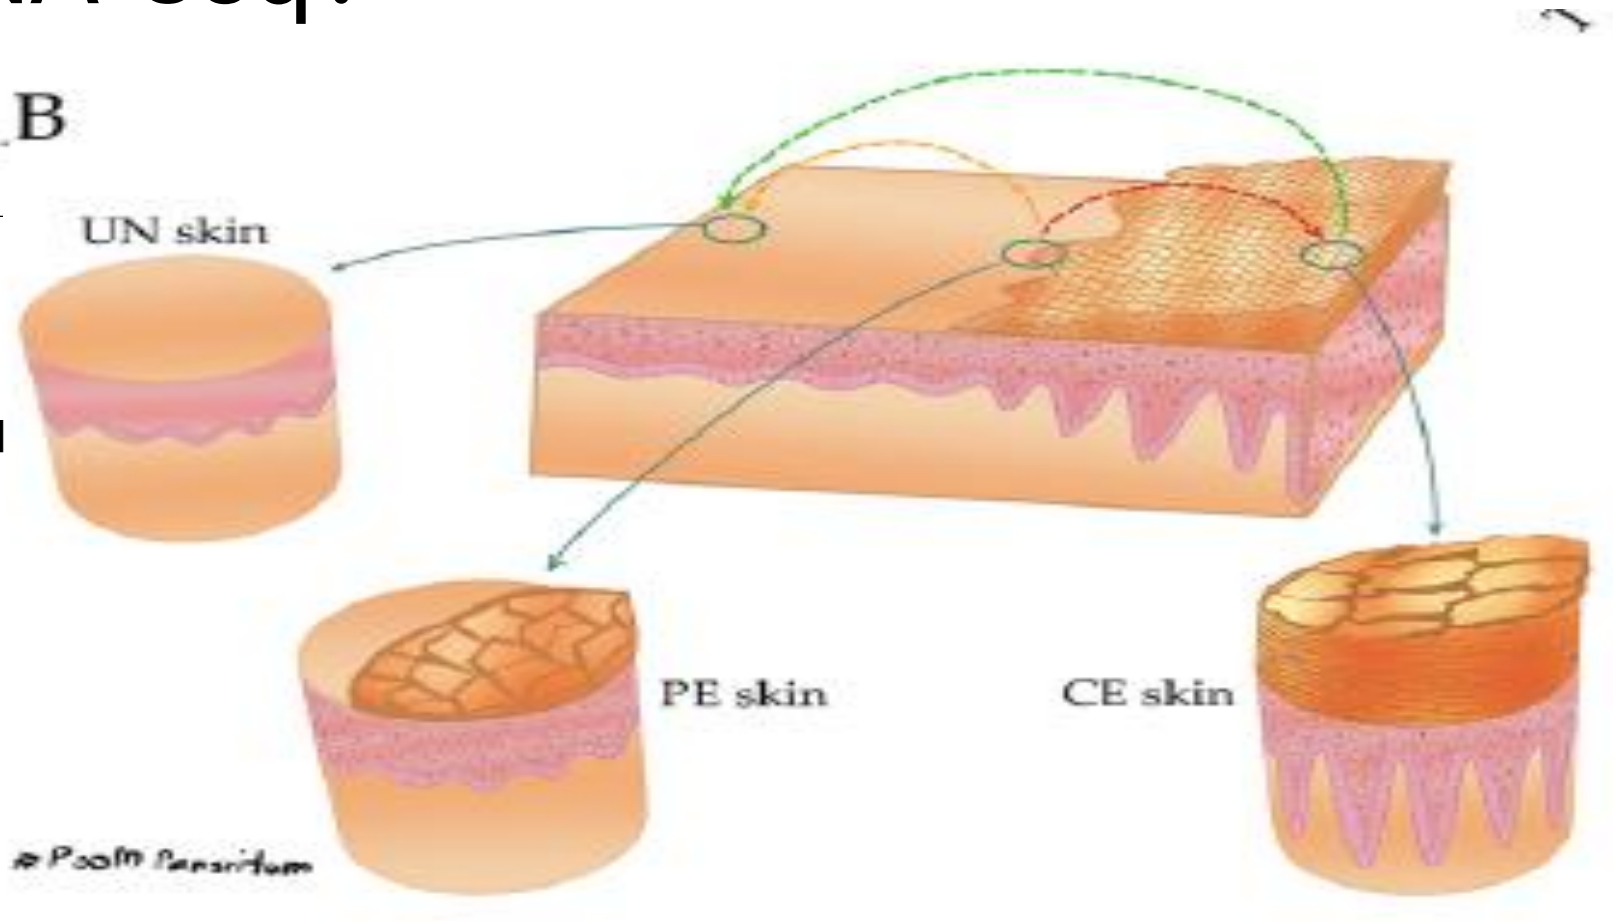


Hwang, B., Lee, J. H., & Bang, D. (2021). Author Correction: Single-cell RNA sequencing technologies and bioinformatics pipelines. *Experimental & molecular medicine*, *53*(5), 1005. https://doi.org/10.1038/s12276-021-

¿Qué es scRNA-seq?

- Tecnología que permite la disección de la expresión génica a la resolución de una sola célula.

- La aplicación Single-Cell RNA-Seq proporciona perfiles transcripcionales que permite comprender a nivel de una sola célula qué genes se expresan, en qué cantidades y cómo difieren los niveles de expresión entre las miles de células contenidas en una muestra



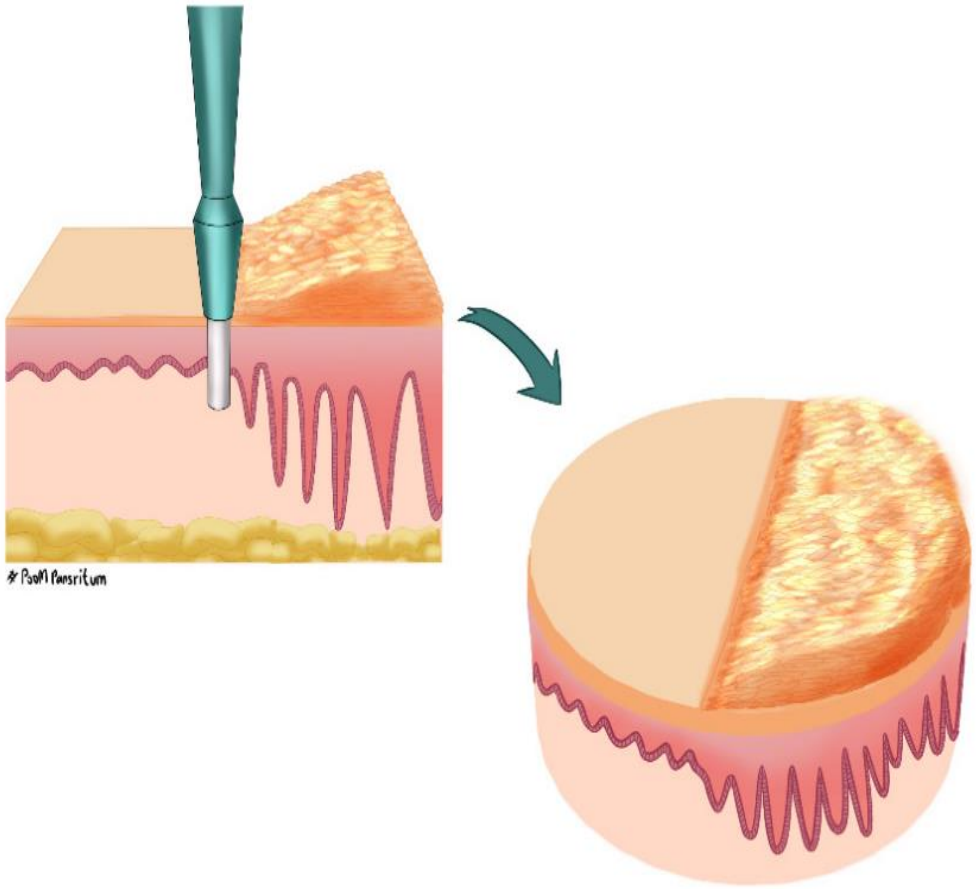
Ventajas RNA-seq

Superioridad frente a otras tecnologías, como la hibridacion de microarrays, para detector nuevas trancripciones

Elimina el ruido experimental, que si ocurre con la hibridación cruzada o subestándar en microarrays

No limitado a secuencias genómicas

Son cuantificables



Hwang, B., Lee, J. H., & Bang, D. (2021). Author Correction: Single-cell RNA sequencing technologies and bioinformatics pipelines. *Experimental & molecular medicine*, *53*(5), 1005. https://doi.org/10.1038/s12276-021-

Las placas psoriásicas no son uniformes, por lo que resulta interesante examinar los perfiles de expresión génica de distintas zonas de las placas que aún no han sido completamente exploradas.

En 2021, se publicó la primera secuenciación de ARN unicelular (scRNA-seq) de piel psoriásica que reveló el perfil de expresión del ARNm de diferentes subconjuntos de células inmunitarias y las distintas capas de queratinocitos

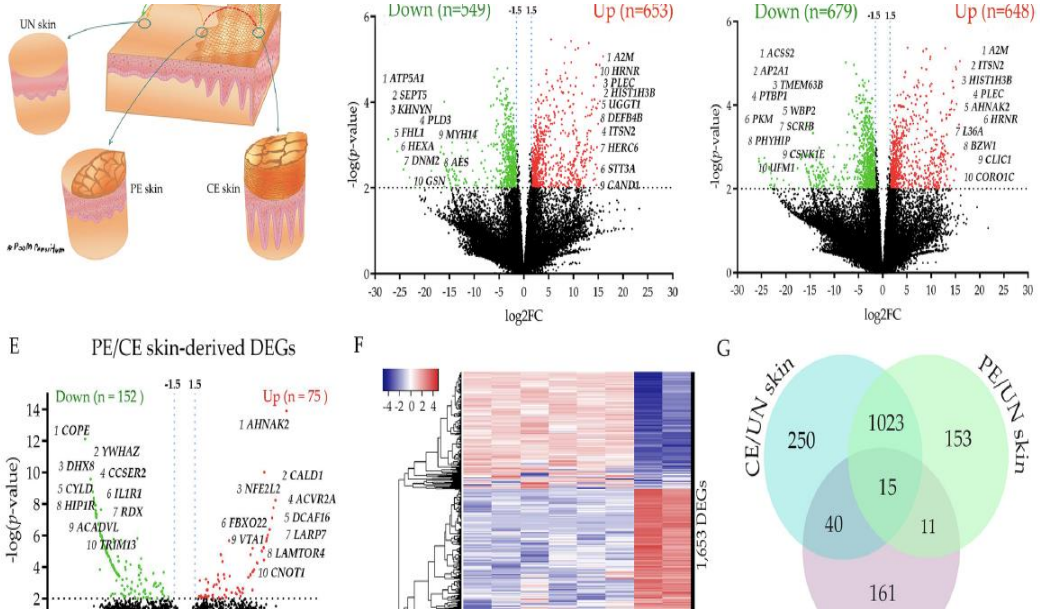
Transcriptomic Profiling of Peripheral Edge of Lesions to Elucidate the Pathogenesis of Psoriasis Vulgaris

Suphagan Boonpethkaew [1], Jitlada Meephansan [1,*], Onjira Jumlongpim [1], Pattarin Tangtanatakul [2], Wipasiri Soonthornchai [3], Jongkonnee Wongpiyabovorn [4], Ratchanee Vipanurat [5] and Mayumi Komine [6]



In contrast, the largest subset of IL-17-producing T-cells isolated from psoriasis lesions are those that are IL-17F$^+$ IL-10$^-$. This population (presumptive IL-17F/F producers) constitutes 53% of T17 T-cells and is about 5-fold more frequent than cells co-producing IL-17A and IFN$_\gamma$. High expression of cytokines such as IL-1B, CSF-2, LTA, IL-24 and IL-34 likely identifies a different inflammatory potential from cells exposing IL-17A and IFN$_\gamma$. Interestingly, this subset has the highest expression of the IL-23 receptor, so it might be the most strongly affected by therapeutic IL-23 antagonists. Perhaps this subset also stems from inflammatory conversion of Tregs, as FoxP3 has the highest expression among all T17 cells. While a recent report found some human blood T-cells synthesized only IL-17F after culture in polarizing conditions[45], we believe this is the first report of a unique and

With our new single-cell approach, we found cutaneous T17 cell subsets with highly differing transcriptomes depending on IL-17A vs. IL-17F expression and IFN$_\gamma$ vs. IL-10 expression: 1) IL-17A$^+$ IFN$_\gamma^+$ T17 cells, 2) IL-17A$^+$ IFN$_\gamma^-$ T17 cells, 3) IL-17A$^+$ IL-17F$^+$ T17 cells, 4) IL-17F$^+$ IL-10$^-$ T17 cells and 5) IL-17F$^+$ IL-10$^+$ T17 cells (Fig 3B). The T17 cell subset that most conforms with current pathogenic subsets[6, 22–24] is the IL-17A$^+$ IFN$_\gamma^+$ population, synthesizing high levels of TNF, IL-26 and IL-36G and mostly within CD8$^+$ T-cells that co-express cytotoxic markers (Tc17 T-cells).

Boonpethkaew S, Meephansan J, Jumlongpim O, Tangtanatakul P, Soonthornchai W, Wongpiyabovorn J, Vipanurat R, Komine M. Transcriptomic Profiling of Peripheral Edge of Lesions to Elucidate the Pathogenesis of Psoriasis Vulgaris. Int J Mol Sci. 2022 Apr 30;23(9):4983. doi:

El EGFR se expresa en la zona central de las placas psoriásicas y promueve la proliferación de Qc y la angiogenesis

Además, el EGF puede suprimir la expresión del ARNm de la IL-6 y la IL-1β, lo que sugiere una alteración del entorno de diferenciación Th17, y puede suprimir la expresión del ARNm de la IL-17A

El HGF es secretado por los fibroblastos dérmicos. Promueve la proliferación de los Qc e induce la expresión de VEGF , promoviendo así la angiogénesis, que podría ayudar a mantener las placas formadas.

Sin embargo, la sobreproducción de HGF reduce la inflamación psoriásica a través de la supresión de la expresión de ARNm de citoquinas clave (IFN-γ, IL-17A, IL-17 F e IL-23) en las lesiones psoriásicas lo que puede dar lugar a la estabilización, y posterior regresión de la placa

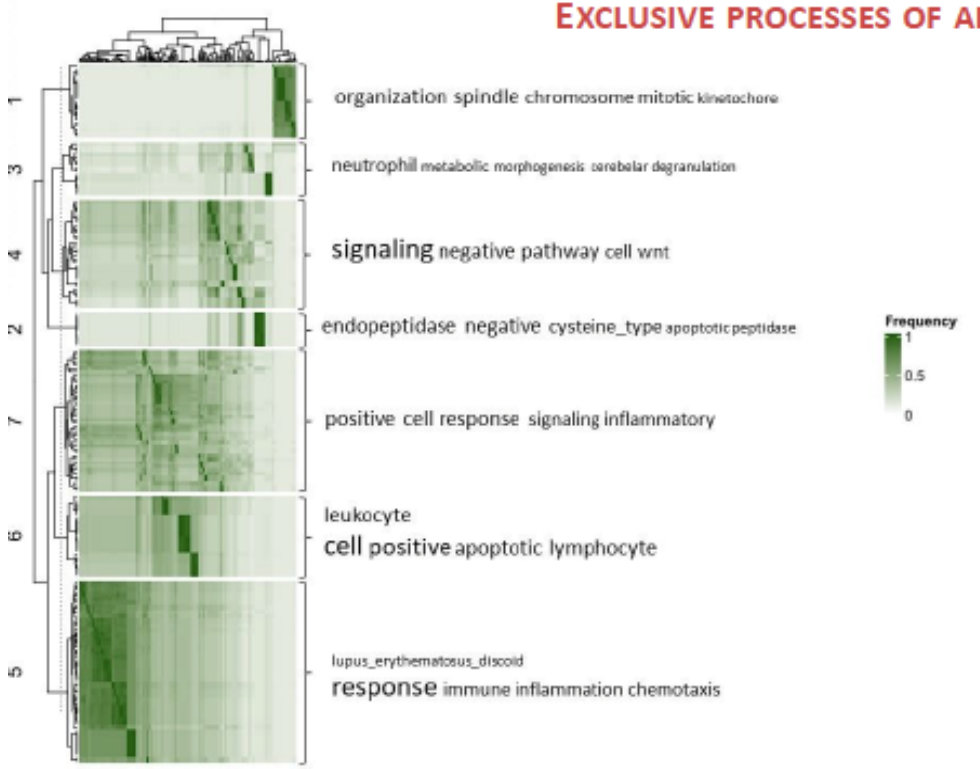
4.3. RESULTS» Enrichment of adult vs. Pediatric signatures

Exclusive processes of adult lesional patients vs healthy control.

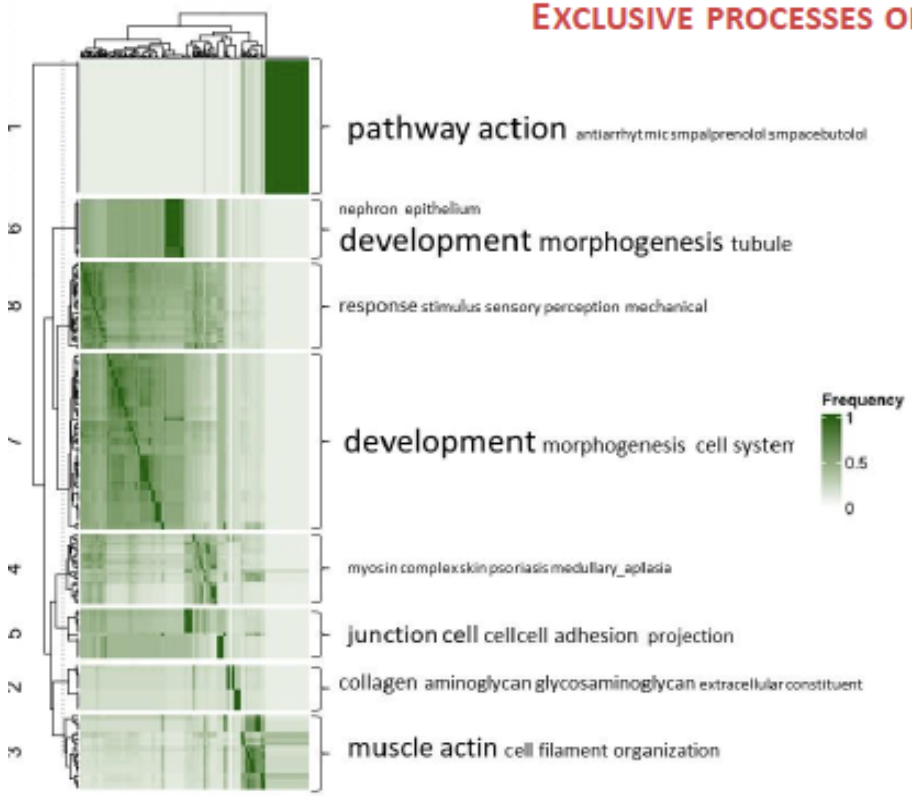


200 PROCESSES				
Process	Epidermal barrier disruption	Innate immunity dysregulation	Adaptative immunity dysregulation	Pruritus and itch
Cluster 1. Cell division				✓
Cluster 2. Peptidases activity	✓			
Cluster 3. Antigen presentation, neutrophil-mediated activity		✓	✓	✓
Cluster 4. Signaling pathways			✓	
Cluster 5. Inflammatory response and chemokine response.		✓	✓	
Cluster 6. T cell activation			✓	
Cluster 7. Inflammation and T cell response		✓	✓	

The processes present **only** in adult lesional samples are: cell division, peptidases activity, antigen processing and presentation, neutrophil-mediated immunity, signaling pathways, inflammation and T cell activation, all included in the following AD characterisation motives: epidermal barrier disruption, innate immunity dysregulation, adaptative immunity dysregulation and pruritus and itch. First of all, these results unravel what processes are present in an adult atopic dermatitis patient. Moreover, cell division, antigen processing and T-cell activation processes have also appeared in common results, which means a higher involvement in adult patients than in pediatric patients, since they have not resulted enriched in pediatric populations. However, endopeptidases activity and signaling pathways (such as NFKB or IFNG signaling pathways) are processes enriched only in adult patients, suggesting its implication in adult patients and not in pediatric ones.

4.3. RESULTS» ENRICHMENT OF ADULT VS. PEDIATRIC SIGNATURES

EXCLUSIVE PROCESSES OF PEDIATRIC LESIONAL PATIENTS VS HEALTHY CONTROL.



249 PROCESSES				
Process	Epidermal barrier disruption	Innate immunity dysregulation	Adaptative immunity dysregulation	Pruritus and itch
Cluster 1. Heart drugs				
Cluster 2. Collagen organization	✓			
Cluster 3. Collagen organization and muscle cell action	✓			
Cluster 4. Cornification of cornified envelope and antimicrobial humoral response	✓	✓		
Cluster 5. Cell-cell junction.	✓			
Cluster 6. Kidney and nephron development.	✓?			
Cluster 7. Morphogenesis	✓			
Cluster 8. Receptor complexes and angiogenesis	✓	✓	✓	✓

The processes present **only** in pediatric lesional samples are: extracellular matrix structure, muscle cell differentiation, humoral response, cell-cell junction, morphogenesis and angiogenesis, some of them included in all AD characterisation motives. However, muscle cell differentiation, morphogenesis and angiogenesis are not covered by our characterisation, because they are not fully studied in an atopic dermatitis environment. Humoral response is a process involved in all phenotype's pathologies. Both ECM and cell junction processes are involved in common analyses and in only pediatric, but not in only adult, suggesting a higher role in the present population. Finally, the other processes (muscle cell differentiation, morphogenesis and angiogenesis) are features of pediatric patients, not involved in adult pathology.

Medical digital twins, which are potentially vital for personalized medicine, have become a recent focus in medical research. Here we present an overview of the state of the art in medical digital twin development, especially in oncology and cardiology, where it is most advanced. We discuss major challenges, such as data integration and privacy, and provide an outlook on future advancements. Emphasizing the importance of this technology in healthcare, we highlight the potential for substantial improvements in patient-specific treatments and diagnostics.

PERLAS PARA LLEVAR A CASA..

- Veremos muchos artículos que estudian el metagenoma…hacernos la pregunta de ¿qué importan esas diferencias?→ estudios que realicen SHOTGUN METAGENOMICS
- SINGLE CELL-RNAseq puede proporcionar nuevos insights sobre los mecanismos fisiopatogenicos
- IN SILICO CLINICAL TRIAL y DIGITAL TWIN para ”democratizar” fm, enf raras…

Muchas gracias
