Vall d'Hebron

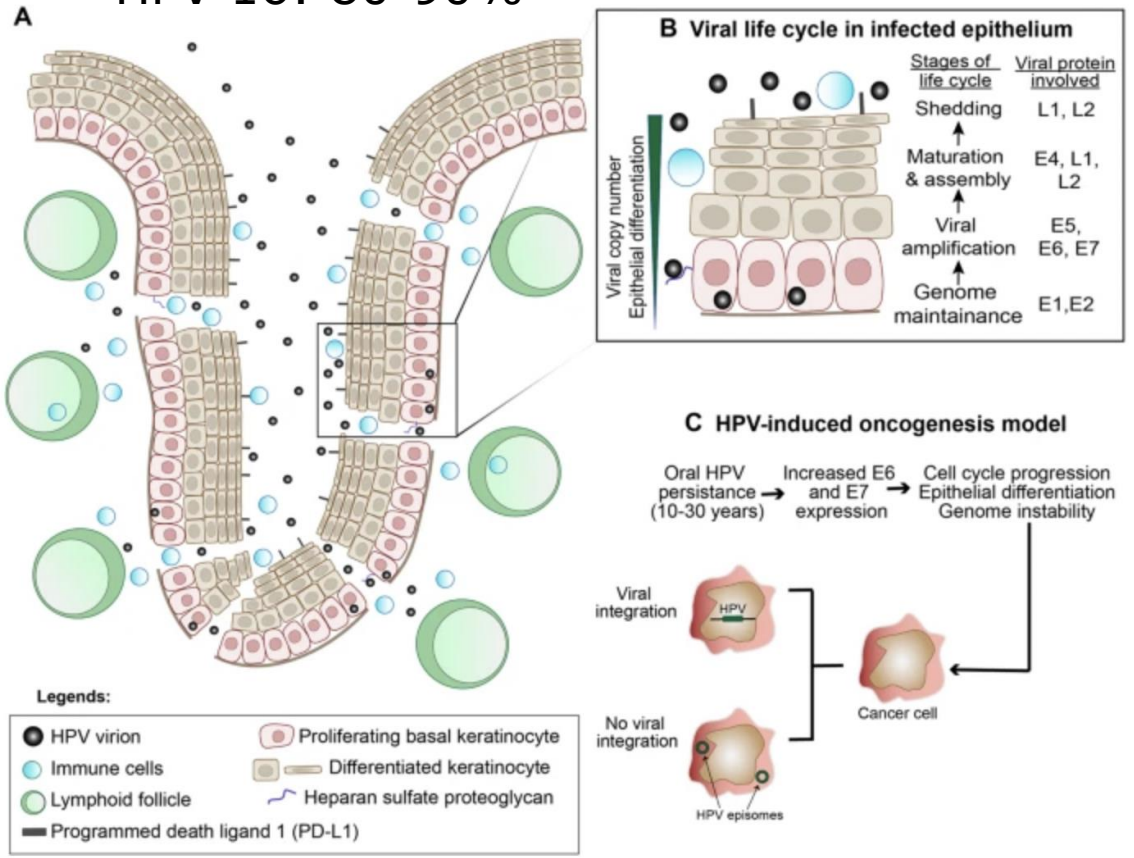
Que succeeix a causa de la infecció HPV ?

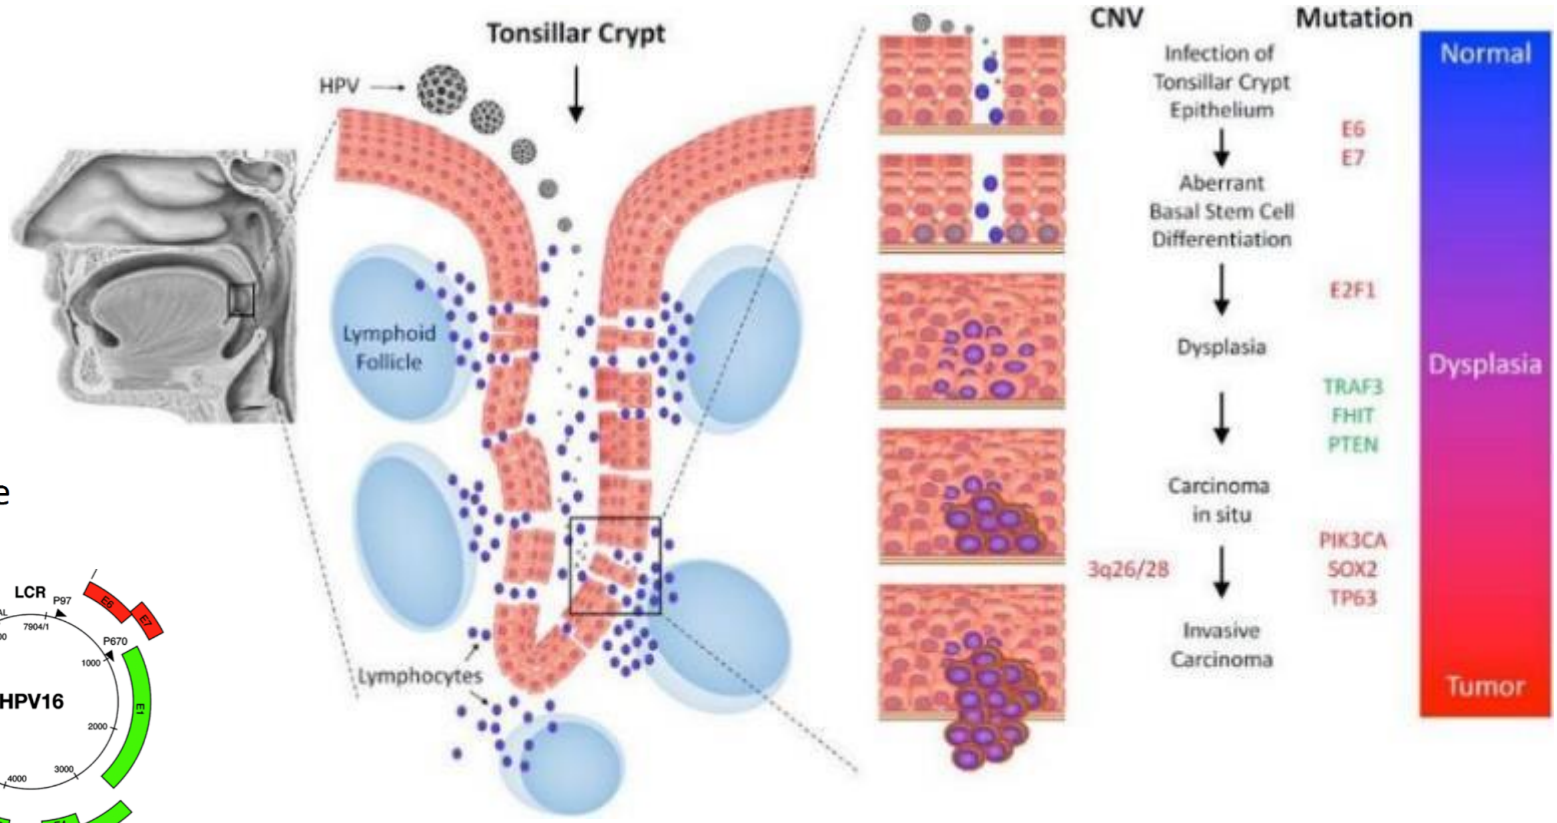
Oncogènesi

HPV 16: 80-90%



Lim, Y.X. et al. *Oncogene* **42**, 2939–2955 (2023).

Oncogènesi



HPV-16 Genome

- Early region
  - E6: inactivates p53
  - E7: inactivates pRb
    - pRb inactivation induces over-expression of p16
- Late region
  - L1, L2: capsid proteins necessary for viral persistence
- Regulatory region
  - Replication/gene expression

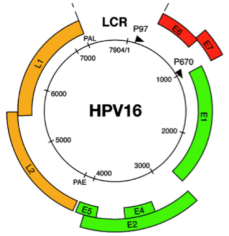
Leemans et al. Nature reviews 2018.

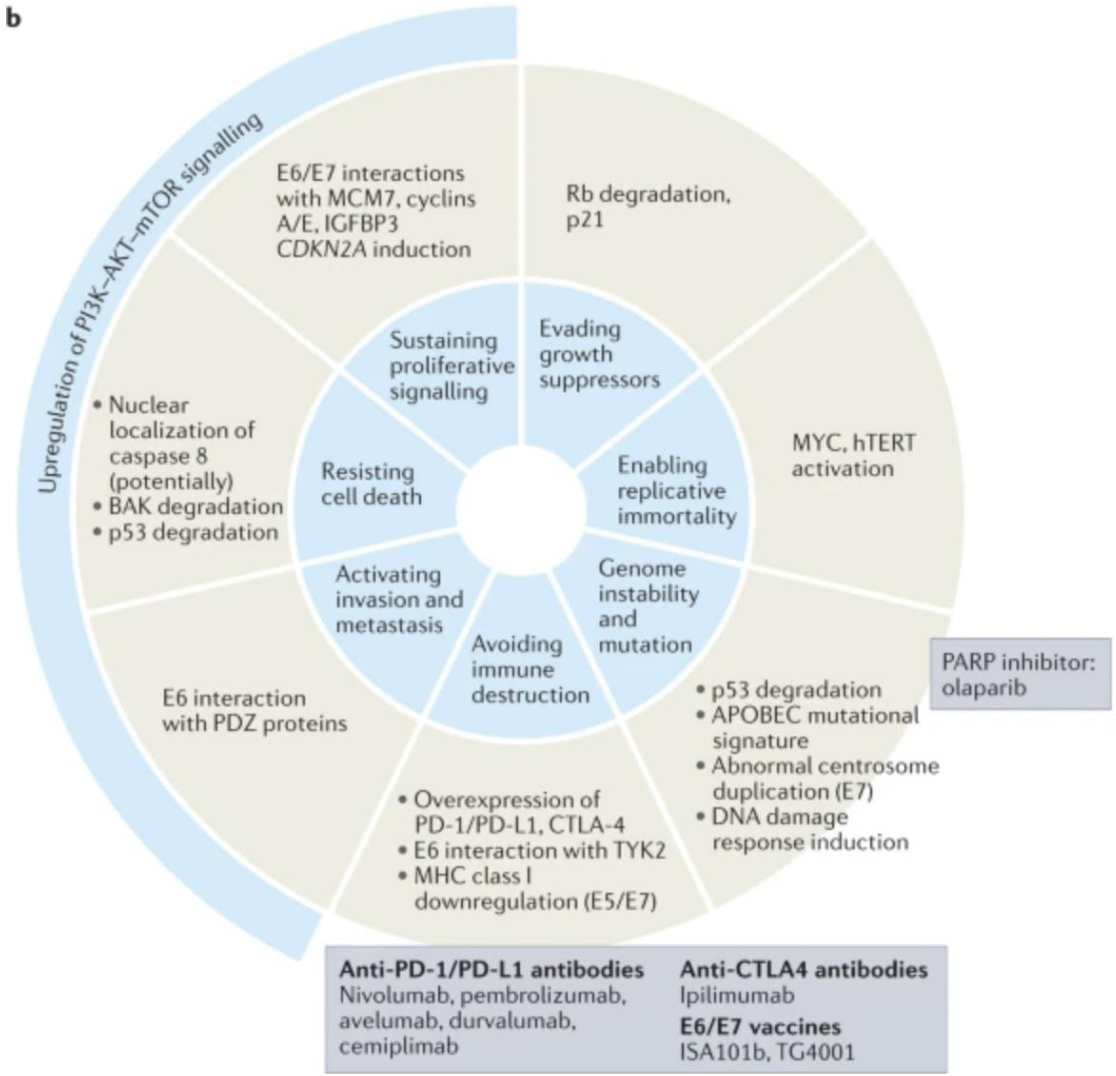
Vall d'Hebron

Oncogènesi

HPV-16 Genome

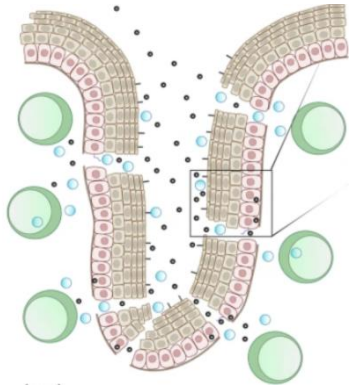
- Early region
  - E6: inactivates p53
  - E7: inactivates pRb
    - pRb inactivation induces over-expression of p16
- Late region
  - L1, L2: capsid proteins necessary for viral persistence
- Regulatory region
  - Replication/gene expression





Lim, Y.X. et al. *Oncogene* **42**, 2939–2955 (2023).

Oncogènesi

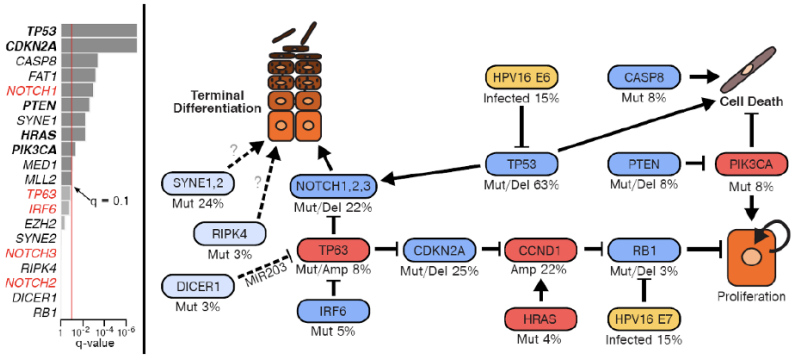


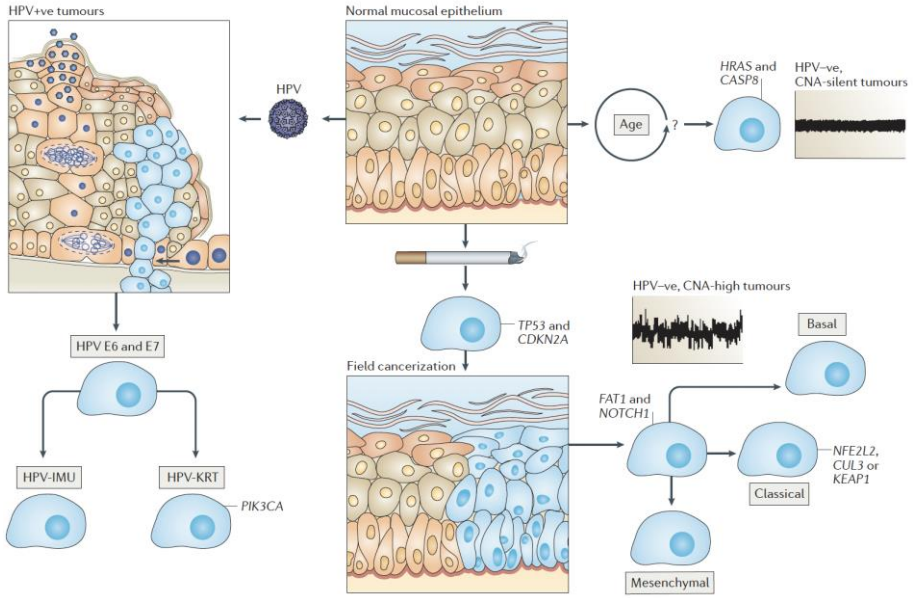
Important tropisme ganglionar

COD → T0

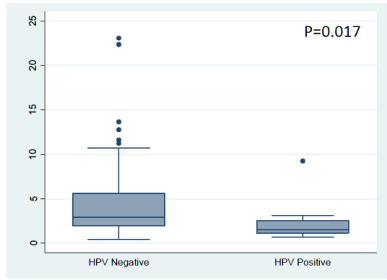
Oncogènesi

Gens reguladors diferenciació escamosa

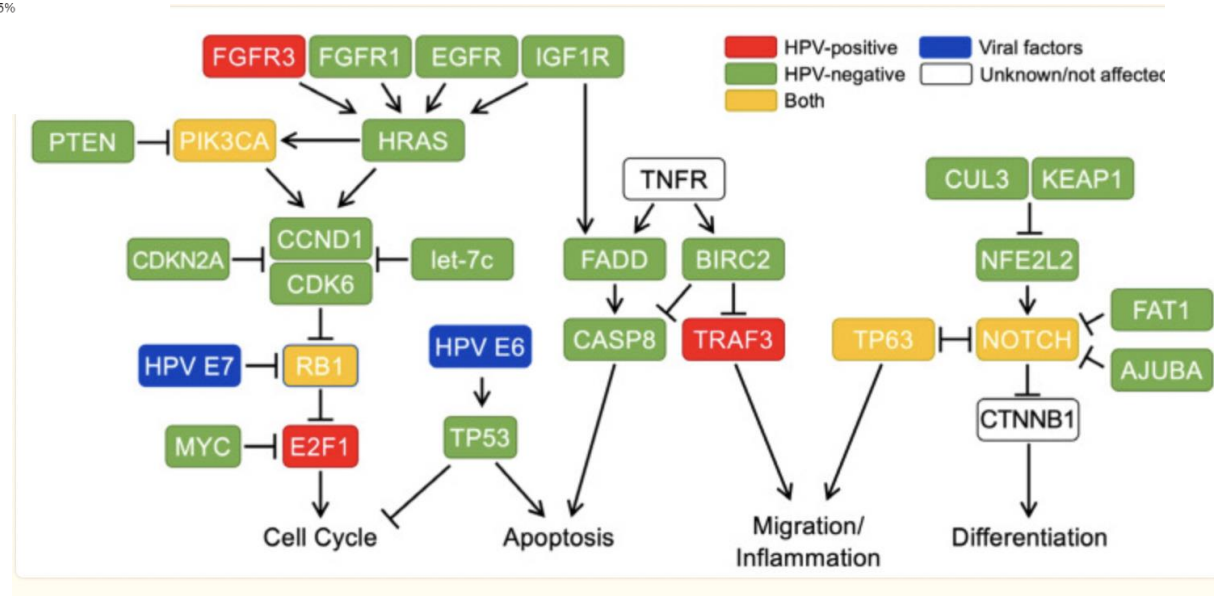




Taxa Mutacional HPV + vs HPV –

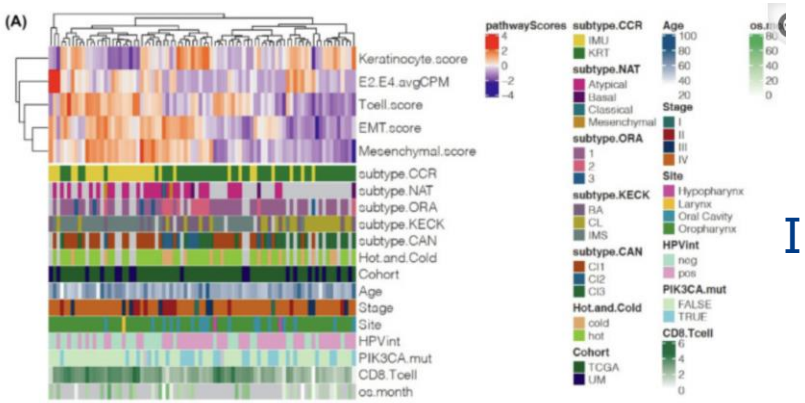


Mutation Rates per MB		
	HPV Negative	HPV Positive
Mean	4.54	2.38
Median	2.98	1.50



Menor taxa mutacional i disregulacions mol.leculars en CEOF VPH +

Oncogènesi



Tres subtipus mol.leculars HNSCC HPV+

I- Baixa integració – Alta diferenciació mesenquimal

II- Altament queratinitzat- basaloide – Alt contingut estromal

Diferències en pronòstic

Relació amb integració VPH – a > -- Pitjor pronòstic (II)

III- Altament queratinitzat – Alt contingut estromal – Rta immunitària suprimida

Vall d'Hebron

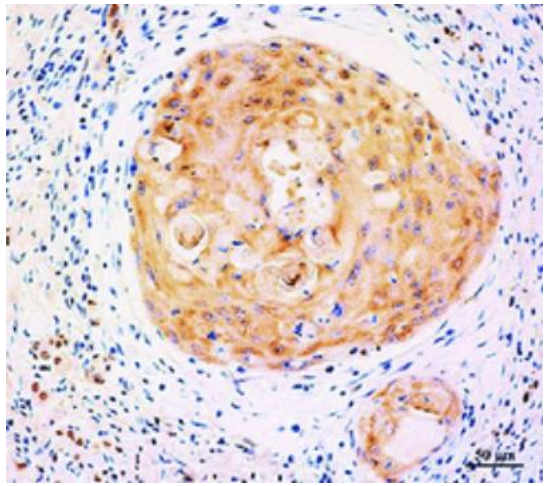
Qin T. et Cancers (Basel). 2021 May 31;13(11):2721

Com el diagnostiquem ?

Diagnòstic

Patologia:

- Biòpsia
- Citologia



P16 IHQ positiva

PCR - HPV – DNA Positivitat

Problemes:

T0 No tumor local. Citologia baix percentatge dx definitiu HPV

No screening

Control posterior??

Mena et al. Oral Oncology. 2018.

Diagnòstic

T0 No tumor local. Citologia baix percentatge dx definitiu HPV

T Orofaringe

Inmunoterapia en diferents règims

Vall d'Hebron

QOL Estratègies desescalada

	Trial	Phase	Regimen	Outcome
Decreased Total Radiation Dose	Chera et al (2015)	II	Weekly Cisplatin (30 mg/m^2) for 6 doses + IMRT (60 Gy in 30 Fx over 6 weeks)	Pathologic CR was 86% with less toxicity profile overall
	NRG HN002	II	Weekly Cisplatin (40 mg/m^2) + IMRT (60 Gy in 30 Fx over 6 weeks) vs IMRT alone (60 Gy in 30 Fx over 5 weeks)	Met criteria for 2-year PFS>85%, MDADI index
Cetuximab vs Cisplatin	RTOG 1016	III	Weekly Cetuximab (400 mg/m^2 load with 250 mg/m^2 for 7 doses) + RT (70 Gy in 35 Fx over 6 weeks) vs Cisplatin (100 mg/m^2 for 2 doses on days 1 and 22) + RT (70 Gy in 35 Fx over 6 weeks)	5-year OS 77.9% (cetuximab) vs 84.6% (cisplatin). Cetuximab arm showed worsening 5-year PFS and locoregional failure with similar late to moderate toxicity profiles
	De-ESCALaTE	III	Weekly Cetuximab (400 mg/m^2 load with 250 mg/m^2 for 7 doses) + RT (70 Gy in 35 Fx over 6 weeks) vs Cisplatin (100 mg/m^2 on days 1, 22, and 43) + RT (70 Gy in 35 Fx over 6 weeks)	All-grade toxicity was similar in both arms, but there was worsening 2-year OS and recurrence rate in the cetuximab arm
	ARTSCAN III	III	Weekly Cetuximab (400 mg/m^2 load with 250 mg/m^2 for 7 doses) + RT (70 Gy in 35 Fx over 6 weeks) vs Weekly Cisplatin (40 mg/m^2) + RT (70 Gy in 35 Fx over 6 weeks)	3-year OS was not significant but favored cisplatin arm. Significant worsening 3-year locoregional control with cetuximab
Induction Chemotherapy with Reduced Dose Chemoradiation	E1308	II	3 cycles of induction Cisplatin (75 mg/m^2) Day 1 + Paclitaxel (90 mg/m^2) Day 1, 8, and Cetuximab (400 mg/m^2 load with 250 mg/m^2) weekly every 21 days followed by either high dose or reduced-dose radiation (69 Gy in 33 Fx vs 54 Gy in 27 Fx) depending on response with weekly Cetuximab (250 mg/m^2)	2-year PFS and OS were 80% and 94% respectively with less grade 3 mucositis and dysphagia
	Quarterback	III	3 cycles of induction Cisplatin (100 mg/m^2) Day 1 + Docetaxel (75 mg/m^2) Day 1, 5-FU (750 mg/m^2) Days 1-4 every 21 days followed by either standard dose or reduced-dose radiation (70 Gy in 35 Fx vs 56 Gy in 28 Fx) depending on response with weekly Carboplatin (AUC 1.5)	3-year PFS and OS >80% seen in both standard and reduced dose RT groups
Immunotherapy	KEYNOTE-012	Ib	Pembrolizumab 10 mg/kg every 2 weeks for 24 months or until progression or unacceptable toxic effects	ORR ~22%, Grade 3/4 AEs occurred in ~13% of patients
	JAVELIN Head and Neck 100	III	Lead-in dose with either Avelumab (10 mg/kg) or placebo followed by Avelumab (10 mg/kg) every 2 weeks + Cisplatin (100 mg/m^2) every 3 weeks + IMRT (70 Gy in 35 Fx over 7 weeks vs chemoradiotherapy alone.	No improvement to PFS, OS, or ORR although no significant worsening toxicity with Avelumab
	NRG-HN004	II	Randomized 2:1 to RT (70 Gy in 35 Fx over 7 weeks) plus either: (arm A) durvalumab (1500 mg) every 4 weeks starting 2 weeks before RT for 7 cycles or (arm B) cetuximab (400 mg/m^2) 1 week prior to RT then (250 mg/m^2) weekly for 8 cycles	Durvalumab arm showed no improvement to 2-year PFS or OS and showed worsening locoregional failure
	NRG-HN005 (ongoing)	II/III	Arm I: Cisplatin on days 1 and 22 + IMRT/IGRT (6 Fx per week) over 6 weeks Arm II: Cisplatin on days 1 and 22 + IMRT/IGRT (5 Fx per week) over 6 weeks Arm III: Nivolumab every 2 weeks up to 6 cycles + IMRT/IGRT (6 Fx per week) over 5 weeks	Seeking to evaluate non-inferiority with PFS when compared to cisplatin + RT as well as superior QOL measured by MDADI
